

Does the mean difference survive removing one domain or instrument?

RQ-P01 (S), source-only selection; 69 physical masters and 557 held spectra. Primary selected CNN minus selected classical; PP-U-MIN, 400-1800 cm^{-1} . Each coloured point removes one of 13 station-instrument domains or one of ten instrument identities (including every domain using that instrument). The black cross retains all 252/260 paired contexts. Axes show M01 and M06 mean differences; M06 combines predictions, not spectra. No refitting. These are descriptive deletions, not independent experiments or confidence intervals.
