

Which observed dependencies widen the interval?

A Individual spectra

B Combined sample predictions

Balanced accuracy difference (percentage points)

RQ-P01 (S); PP-U-MIN, 400-1800 cm^{-1} , source-only selection. 69 physical masters, 557 held spectra, 13 domains and ten instruments. Same fixed primary difference and 252/260 common contexts. Lines are 95% percentile intervals from 10,000 positive-weight draws, conditional on saved fits and observed support. The original hierarchical interval is unavailable: all 10,000 draws had an originally represented empty chemical group. This sensitivity does not replace the original advancement criterion.
