

Best-epoch distribution: held-instrument evaluation (master-CV guard fits)

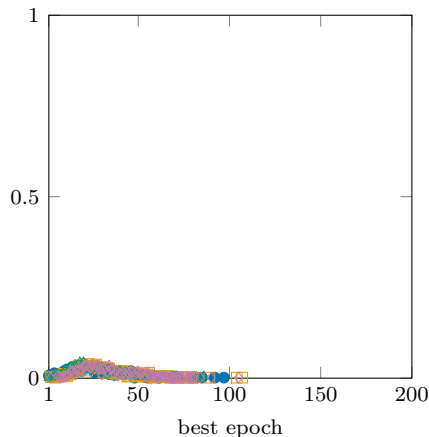

(A) CWA

(B) Pills

(C) Surfaces

• D0-M □ D1 △ D2 ◇ D3

Each point is the fraction of source fits selecting that best epoch for a station, phase, slot kind and recipe, aggregated across selection modes.

A best epoch can be as early as epoch 1 although the run must train for at least 30 epochs; this does not authorize a new schedule and does not imply a terminal epoch.

No interpolation, smoothing or confidence interval is shown.
