

Source versus outer balanced accuracy: development (M01)

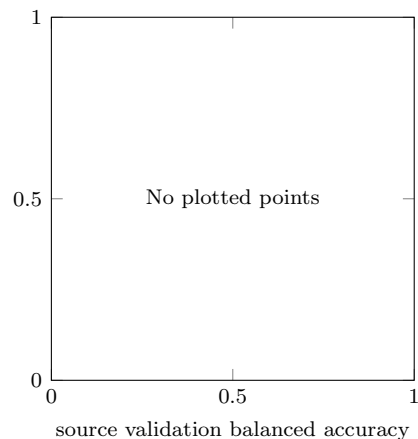

(A) CWA: pseudo-domain

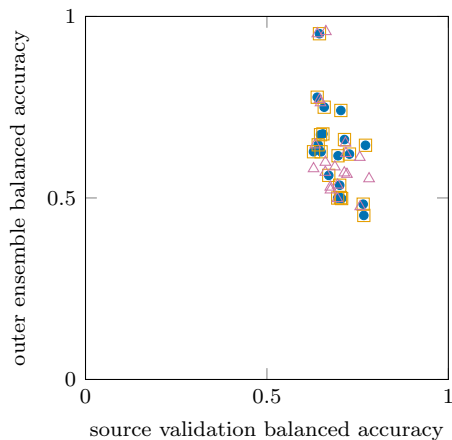

(B) Pills: pseudo-domain

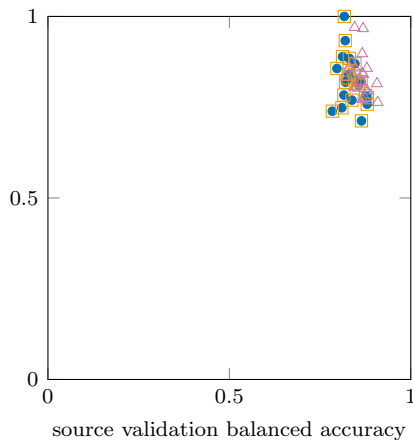

(C) Surfaces: pseudo-domain

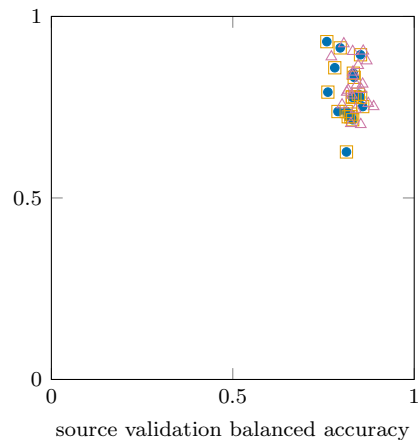

(D) CWA: master-CV

(E) Pills: master-CV

(F) Surfaces: master-CV

• Matched CNN (D0-M) □ Source-selected CNN △ Combined-loss CNN (D3)

The source coordinate averages per-spectrum best-validation balanced accuracy across seeds within each inherited selection unit, then equally across units; guards are excluded.

The outer coordinate is the registered three-seed probability-averaged ensemble metric.

These are different estimators: the source score was used for selection and is optimistic; their difference is descriptive, not an unbiased transfer gap.

Pseudo-domain validation and master-only validation are shown separately; availability does not establish successful generalization.

M01 scores individual spectra after three-seed probability averaging.

M06 averages probabilities within each instrument, then equally across instruments for a sample; raw spectra are not averaged.
