

P05 paired balanced accuracy: new strategies vs C-EXTRA-TREES (M01)

(A) CWA

(B) Pills

(C) Surfaces

Each point is a station-instrument domain mean balanced accuracy over common complete outer contexts. Only domains with at least one common complete outer context are plotted; absent points are not imputed. Repeated outer splits are not independent chemical samples.

New neural strategies average three-seed calibrated probabilities before scoring.

M01: individual spectra. M06: instrument-balanced mean prediction per physical sample, not averaging raw spectra.

Sparse-class balanced accuracy covers observed classes only; no significance or confidence-interval claim is made.

Empty panels indicate no common complete contexts for that station.
