

P08-F01-D02 RQ-S01 cwa Mira-2
held comparison domain
Population: 598 stored spectra from 69 physical masters; per-cell counts shown
Access: fixed universal preprocessing; no target fitting
Independent unit: physical master Scope: descriptive primary-population display
semantic sha256: 579370ea5cfa521fe566679494e9b32af4f67eba04d926dc2913520d72b8e6ef

— MIN - - - SG - . - . arPLS

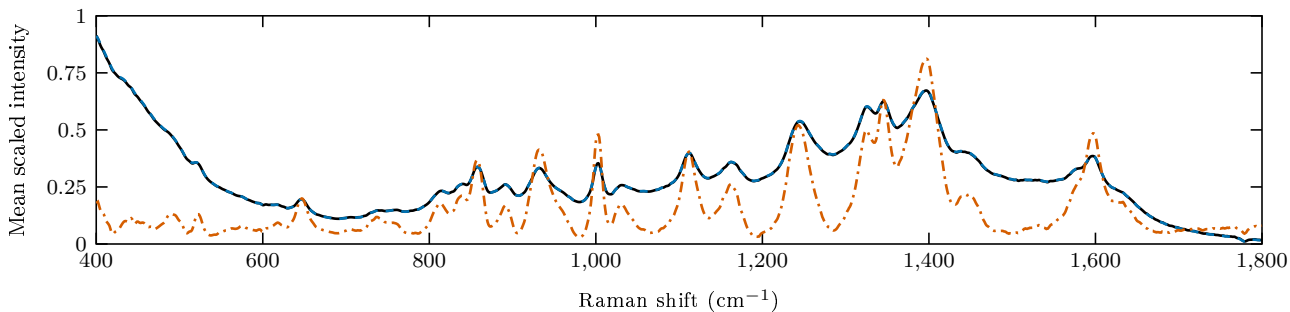

A. 4_nitrophenol (physical masters: 8; stored spectra: 28)

B. ethanol (physical masters: 9; stored spectra: 24)

C. ethyl_paraoxon (physical masters: 7; stored spectra: 20)

MIN is the minimally processed, min-max-scaled representation, not raw instrument counts. Curves average repeated views within each physical sample and then give samples equal weight. These are descriptive displays, not averaged inputs to the classifier; they do not establish recovery of pure chemical spectra or peak preservation. No uncertainty interval or significance test is shown. Source caption: P08-F01 public spectral display. The first trace is the MIN representation, not raw instrument counts. Curves are master-equal descriptive averages of stored measurements, with each stored observation counted once; they are not the model's averaged inputs and not individual-master traces. Differences among representations illustrate whole-pipeline changes and do not establish chemical peak preservation. Cells in exploratory domains are labelled and do not enter the primary held comparison; unavailable cells are retained with a reason. No confidence interval, error bar or significance claim is made.
